

# Fast Track to Seamless and Speedy Travel

The Automatic Fare Collection (AFC) Solution is an interactive revenue collection system for metro operators, which comprises the Interactive Traveller Terminal (ITT) and the Advance Fare Gate (AFG). Engineered in-house, they are ergonomically designed to help operators optimise operational efficiency and resource utilisation, while enabling commuters to enjoy a seamless, time-saving and dynamic travel experience.

## Interactive Traveller Terminal (ITT)

The ITT is a one-stop interactive platform with a complete, high definition video conferencing system that serves as a live helpdesk, allowing commuters to communicate with a remote operator for assistance.

Commuters can also perform activities such as ticket purchase, card value top-ups, as well as the creation of a Personal Travel Account, a new feature which facilitates hands-free access at the AFG.

Another value-add feature of the ITT for the business operator is the option to screen advertisements on the system, and the ability to perform facial recognition analytics, for the profiling of commuters that can be used in targeted advertising.

## Advance Fare Gate (AFG)

The sleek and intuitive AFG enables metro operators to offer multiple payment choices for their commuters. Embedded with the Smart Tag or Facial Recognition technology, a registered commuter can walk through the entry and exit points without the need to physically tap their cards on gate readers. Technology-savvy commuters can also enjoy cashless payment methods via credit cards, debit cards, the latest modes of mobile payment as well as the contactless Smart Card.

The AFG features a sleek design with a reduced footprint.

The Card reader placement is designed to be more user-friendly through an intuitively designed side tap and display screen.
